

- CodeRegression.src.Operators - directory, where we have general functions to build methods (utils) and components to build algorithm pipelines (methods)
- CodeRegression.src.Operators.Utils - directory, where we have general functions that we use in multiple methods
- CodeRegression.src.Operators.Utils.some_utility - classified general functions, for example to search for literals (public)
- CodeRegression.src.Operators.Methods - directory, where we have methods to construct custom pipelines from
- CodeRegression.src.Operators.Methods.some_method - simply name of the method that implemented with various algorithms (public)
- CodeRegression.src.Operators.Methods.some_method.some_algo - simply implementation of the given method with specific algo. We MUST guarantee that every algo takes and outputs the same set of params (public)

- some_algo.core - core structures and its functions (private or static)
- some_algo.operations - all functions that exclusively some_algo uses. (private or static)
- some_algo.utils - general functions that doesn't classify to core and operations, it is only for inner subalgos (private and static)
